

# KGID Spring 2022

May 10, 2022

## LH Presentation Summary

### 1. Presentation Title

**“Innovative Approach for slum upgrading & GHG emission reduction”**

### 2. Presentation Summary

The world is experiencing rapid urbanization and it is expect to reach at 6.6 billion in 2050, the increase in urban population is especially notable in developing countries, when we are facing urbanization,

If we are facing unprepared urbanization it cause many severe urban problems, the rapid urbanization and urban problem is happening in Pakistan as well, Pakistan is suffering from lack of housing, which generates informal settlements like people in the Kachi Abadis.

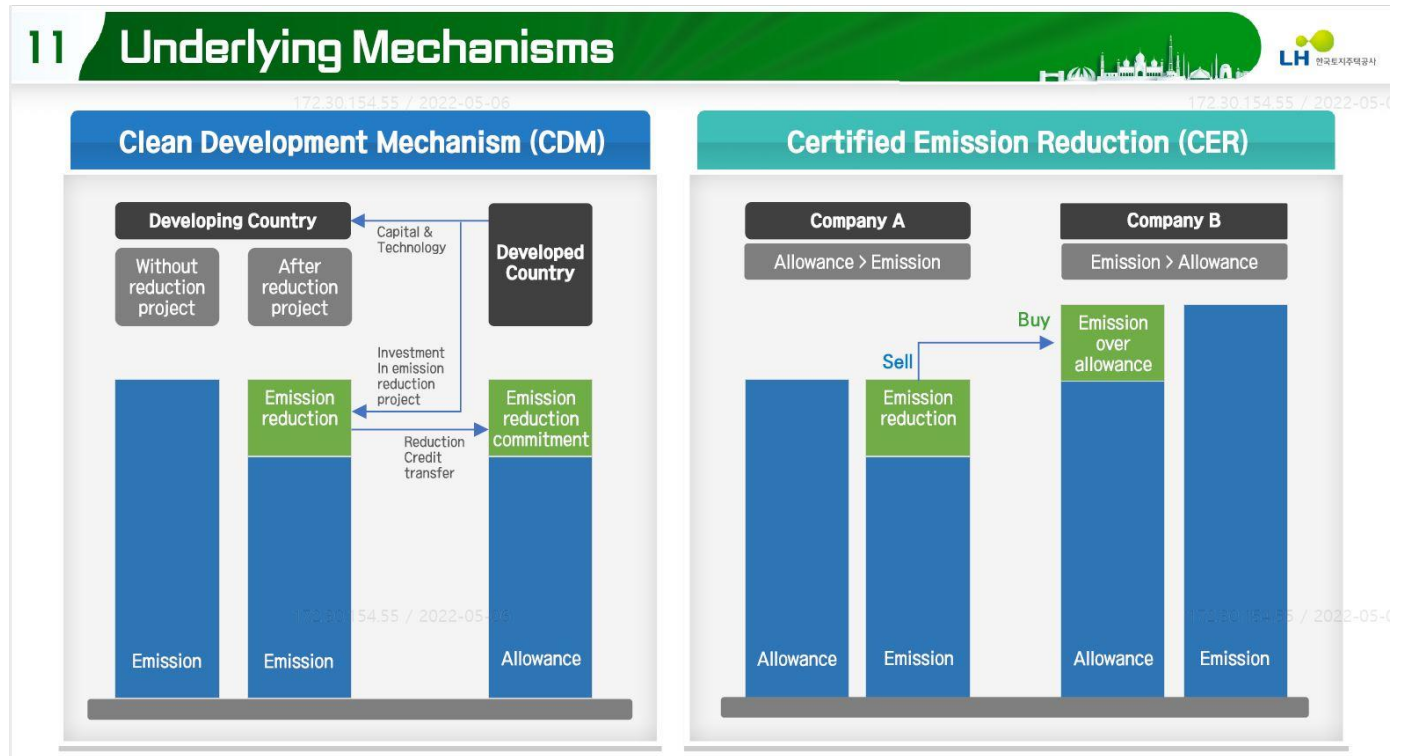

In the meanwhile, the world is facing climate change issue and Korea is one of the largest contributor of greenhouse gas emission, the government is working hard to deal with this issue but 40% emission reduction by 2030 is challenging goal.

so Korea is focusing on clean development mechanism(CDM) to achieve the emission reduction target while supporting sustainable development of the world, to deal with the issues in both in Korea and Pakistan, we have focused on the 2 mechanisms which are Clean Development Mechanism(CDM) and Certified Emission Reduction (CER).

Using the CDM and CER mechanism, we are developing the business structure to invest in the Slum upgrading project in Pakistan using the resources from the CER's sales,

More specific information is not included in this summary because it needs Pakistani government's approval which we would get until presentation, for more information, please join the session.
